CHAPTER V

CLOSING

A. Conclusion

Based on the results of the research that has been carried out. Likewise, based on the calculation of the results of the t-test or hypothesis testing carried out on the posttest value of the two groups, namely experimental and control using SPSS 24 for Windows which produces a probability value of significant (2-tailed) is 0.021. So it can be concluded that Ha is accepted and H0 is rejected. Because Ha can be accepted if < 0.05, and the data shows that 0.021 < 0.05.

It can be concluded that there is an influence on the application of the speed reading technique to the improvement of the comprehensive reading ability of the students of SMPN 2 Pabuaran in learning English. This can be seen from the comparison of the average value of the pretest-posttest results of the experimental class and the control class. The average pretest obtained by the experimental class is 55.7. Meanwhile, the average pretest obtained by the control class is 44.6.

B. Suggestion

Based on the results of the study, the researcher can provide suggestions that can be used as material for consideration and at the same time material for the closing of this thesis, namely:

- Teachers of English subjects at SMPN 2 Pabuaran Serang should use the speed reading method as a new innovation in learning to read as well as a way to improve students' comprehensive reading skills of reading materials.
- Institutions related to curriculum development can take the results of this research into consideration for determining student competency standards.
- Other researchers are expected to find more effective speed reading learning strategies, so that each student is able to achieve the predetermined competency standards.
