

CHAPTER V

CONCLUSION AND SUGGESTION

A. Conclusion

Based on data description in the previous chapter, the result concluded as follow:

1. According to the results of the questionnaire students' perception on joining the English club, the rating score of index perception is 88%. It means that students who take part in English clubs have a positive perception of English clubs to improve their speaking skills.
2. based on the speaking test collected by the students to find out the students' speaking ability, the data showed that the mean of the speaking score is 76.38. it means most of the students in the English club have good level.
3. The result of the correlation is 0,247. From the analysis, the hypothesis t_{count} and t_{table} in the data is $t_{count} = 1.079$. $t_{table} = 1,734$. From this result, we can see if the $t_{count} < t_{tabel}$ so, H_0 accepted and H_a rejected. This hypothesis means that there is no relationship between student's and students' speaking ability.

B. Suggestion

Based on the conclusion above, the writer would like to give some suggestion. Hopefully, it can be useful for the information.

1. students : Do your best as a student until time as a student is finished. Be confident in improving your interest, always practice and learn.
2. teacher : Teacher needs to motivate students' belief in themselves until they are confident to speak up.
